

Impact Atlas

Field photos in. Proof out.

A tool that turns field photos and videos into evidence you can search, prove and send.

The problem

- Field teams take thousands of photos and videos
- They end up in phones, WhatsApp and shared drives
- Nobody can search them by what is in them
- Nobody can prove where and when they were taken
- Reports take days to put together by hand

What a shared drive looks like

new folder (7)/IMG_2044.jpg
boat??.jpg

Chennai flooded in 2015 and again in 2023. The proof was scattered across phones.

What we built

Atlas turns field photos into organised, searchable evidence.

It reads

AI reads every photo and writes a caption, tags and a severity rating

It organises

Files each photo by site, phase and event, with no manual sorting

It answers

Ask in plain words and get answers with the photos attached

It reports

Compare before and after, build a report, send it to the right person

Who uses it

Field team

- Uploads from a phone
- No sorting or typing
- Sees it filed in seconds

Analyst or officer

- Finds proof fast
- Asks questions in plain words
- Sends a report in one click

Donor or judge

- Sees where and when
- Sees what changed
- Can trace every image to its original

How it works

Every step is shown on screen while it runs, so you can see what the AI did.

Studio: photo to evidence on one screen

- Drop a photo or pick a sample
- Five steps run live: upload, record, understand, organise, index
- Your original sits next to the Clouinary version, which is smaller with the same look
- Caption, severity, site and IDs fill in as each step finishes

Real screen: a rescue photo from Cyclone Michaung, filed under Velachery.

Library: it organises itself

- Groups photos by site, phase, severity and event
- The evidence map shows the whole archive at once
- Search by what is in the photo
- If the AI is unsure, it says "Needs review" and a person confirms

Each tile is a real group. Wider means more photos. Redder means more severe.

Ask: plain questions, answers with proof

- Ask a normal question
- It searches three ways: the words, the meaning, and what the picture looks like
- Every answer points to numbered photos
- It checks its own claims and flags what is not backed up

The screenshot shows the 'Ask' interface on the Impact Atlas website. The left sidebar contains navigation links: Impact Atlas, Chennai Flood Watch Collective, Work, Studio, Library, Ask (highlighted), Analyze, Compare, Reports, System, Workflow, Playbooks, and Guide. The main content area is titled 'Ask' and includes a sub-header 'Natural-language questions over your whole archive. Every answer names its sources.' Below this is a search bar with the question 'Where were rescue boats used, and how bad was the flooding there?'. The interface displays three tabs: Plan, Review, and Read and answer. The 'Plan' tab is active, showing a list of search results. The results are organized into a grid of numbered photos (1-9) with captions and source information. The photos show various scenes of flooding and rescue operations in Chennai, India. The interface also includes a 'Severe flooding' filter and a 'Show this answer was made' button.

Ask
Natural-language questions over your whole archive. Every answer names its sources.

Where were rescue boats used, and how bad was the flooding there?

Plan **Review** **Read and answer**

1. Looking for: rescue boats, flooding, rescue boat, flood, flood, rescue boat
2. In: 12 of 87 items via keywords + meaning = visual
3. By: remember: 3-nano-emo-300-400-remember: 7 sources cited, grounding verified

Rescue boats were used in Velachery and city-wide locations during severe flooding (severity level 3). 1 2 3

- Velachery saw rescue boats during Cyclone Michaung 2023 with deep floodwaters 1 3
- City-wide areas experienced rescue operations in severe flooding during 2015 floods 2 4
- Buckingham Canal and Adyar River sites showed flooding but no rescue boats in evidence 3 6
- Severity levels ranged from minor (1) to severe (3) across all sites 2 3 6

Please verify before relying on this 11 citations valid, all figures traced - claim check 4/5 supported

Reports and alerts

- One click builds a report from any set of photos
- Photo credit and licence on every image
- Before and after slider, only for the same place
- Share by private link, email or a share card
- Print to PDF or download as Markdown

Chennai Flood-Watch: the first real use

- Atlas is a general tool. A playbook adds a place and a job
- The Chennai playbook adds live rain and river data
- A 0 to 100 risk score, with all six parts shown
- The report goes to the officer for that zone
- "Rehearse a storm" is always labelled as a simulation

The amber boxes are what the Chennai playbook adds to the general pipeline.

How we use Cloudinary

Signed uploads

The browser sends photos straight to Cloudinary

Smart crops

Thumbnails, comparisons and report images are just URLs

Tags and IDs

All tags saved on the asset, originals never edited

AI Vision

Reads each image: caption, severity, risks

Share cards

Text overlays build the share image

Traceability

Each report image records its exact transformation

Built to be trusted

- Real photos, with credit and licence
- Live rain and river data. Simulations are always labelled
- The AI checks itself. Unsure results go to a person
- Works without AI keys, using simple rules instead

Next.js, Supabase, Cloudinary, NVIDIA Nemotron, Open-Meteo. Diagram made with Archify.

What is next

- More playbooks: forests, waste, bridges, wildlife
- Read video frames, not just photos
- Alerts by SMS and WhatsApp
- Move search to pgvector for bigger archives

Thank you
